University**

Lab Report

Course Title : Computer Networking

Course Code : CSE0612306

Submitted By -

Name : **MD. HASAN SOJIB**

ID : **2233081419**

Section : **60 - H**

Program : **BSc in CSE**

Submitted To -

Name : **RAWSON TABASSUM**

Department of : **CSE**

Uttara University

Date of submission :

Signature of Teacher

Cisco Packet Tracer

Cisco Packet Tracer is software that is used to configure network devices and connect them to simulate networking operations. We can configure some virtual networks to this software to simulate connection and data transmission.

There are two types of devices. Network devices and End devices. Network devices are those which connect some end devices to establish a connection between end devices for communication. End devices are those which mainly communicate to each other through a network.

Network Devices

- **Router:** Router mainly connects some networks.
- **Switch:** Switch connects some end devices in the same network to communicate with each other.
- **Firewall:** Protects networks by filtering traffic.

End Devices

- PC
- Laptop
- Mobile
- Server
