Lab Report

Course Title : Computer Networking

Course Code : CSE0612306

Submitted By -

Name : MD. HASAN SOJIB

ID : 2233081419

Section : 60 - H

Program : BSc in CSE

Submitted To -

Name : RAWSON TABASSUM

Department of : CSE

Uttara University

Date of submission :

Signature of Teacher

4 Network Topology

Network topologies are mainly how devices are organized in a network to communicate to each other. There are 4 common topologies used to design a network. Below discussing about those 4 topology:

1. Bus Topology

Bus topology is a type of topology where all the devices are connected to a single cable to communicate to each other. Here the cable is a straight cable that two end points and single are transferred through this cable. Low cost needed to design bus topology.

2. Star Topology

Star topology is a type of topology where all devices are connected to a central device for example to a switch or hub so that all devices can communicate to each other through that central device. Medium cost needed to design star topology.

3. Ring Topology

Ring topology connects all the devices through a circular single cable. This is a little bit same as bus topology but in bus topology that single cable is not in circular shape. There are two end points. But in ring topology the cable is circular. Ring topology is also medium expensive.

4. Mesh Topology

Mesh topology is the most reliable network topology as well as the most expensive to design. Here all the devices are connected to all of each other. So there is a direct connection between every device.
